Instructions:

The NodeJS server is located in the server folder. You should place the JSON file you will use to test (call it favs.json) in the same folder (like I have). Then in a command line, go to the same directory and type in "node server.js" (without quotations) to run the server on localhost:3000. It might take a couple of seconds the first time. The console will write an output message letting you know when it is ready. You can then open a browser and go to localhost:3000.

Here are the list of REST API calls you can use. You should type it right after the localhost3000 in the browser:

1) /tweets	This is used to get either all tweets if you type it as shown or get a specific tweet by id if you type in /tweets/*theID*
2) /users	This is used to get either all the users if you type it as shown or get a specific user by their screen_name if you type in /users/*screen_name*
3) /links	This is used to get all the links that are available and group them by tweet id.

You can also just use the buttons and text fields to get the same thing done.
